

ABSTRACT OF THE DISCLOSURE

A wide vision rearview mirror apparatus includes a generally rectangular planar mirror mounted within an elongated mirror housing extending along a longitudinal axis substantially across the windshield of the vehicle, and a pair of spaced adjustable mounts extending from the back portion of the housing for mounting the housing to the windshield. The planar mirror preferably extends at an angle to the longitudinal axis. Each mount comprises a telescopic main body extending generally perpendicular to the housing, and joint mechanisms extending from either end. The joint mechanisms can provide a wide range of adjustments which enable the mirror and housing to be adjusted to suit a wide variety of drivers.
